FACTOR SIGNALLING:

-1- ALTERNATIVE PRODUCTS: 2 ISOPORMS; A SHORT FORM/NC1-303 AND A LONG FORM/NC-493 (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: PRESENT IN MULTIPLE ORGANS WITH HIGHEST LEVELS.
IN LIVER, LUNG AND KIDNEY.
-1- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
-1- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
-1- POLYMORPHISM: There is an association between a polymorphism in position 1437 and prostate cancer. Heterozygous Asn-1437 individuals have a 2.5 times increased chance of developing individuals have a 2.5 times increased chance of developing individuals have a 2.5 times increased chance of developing or state cancer as compared with homozygous Asn-1437 individuals.
-1- DISEASE: Defects in COLIBAL are cause of Knobloch syndrome (KS or KNO); an autosomal recessive disorder defined by the occurrence of high myopia, vitreoretinal degeneration with retinal detechnant, macular abnormalities and occipital encephalocele.
-1- SIMILARITY: BELONGS TO THE FIREL.ASSOCIATED COLLAGENS WITH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the Buropean Bioinformatics Institute. "Novel missense mutation resulting in the substitution of tyrosine by cysteine at codon 597 the type x collagen gene associated with Schmid metaphyseal chondrodysplasia.";
J. Hum. Genet. 43:259-261(1998).
-!- FUNCTION: TYPE X COLLAGEN IS A PRODUCT OF HYPERTHROPHIC CHONDROTOCYTES AND HAS BEEN LOCALIZED TO PRESUMPTIVE MINERALIZATION ZONES OF HYALINE CARTILLAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DYSPLASIA (SMD). SMD COMPRISES A HETEROGENEOUS GROUP OF HERITABLE SKELETAL DYSPLASIAS CHARACTERIZED BY MODIFICATIONS OF THE VERTEBRAL BODIES OF THE SPINE AND METAPHYSES OF THE TUBULAR BONES. SIMILARITY: STRONG, TO ALPHA 1 AND 2 TYPE VIII COLLAGENS. SIMILARITY: CONTAINS 1 C1Q DOMAIN.
                                                                                                                                                                                                                                                                     -: SUBUNIT: HOMOTRIMER.
-: PIM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
-: DISEASE: DEPECTS IN COLLOAI ARE THE CAUSE OF SCHMID TYPE METAPHYSEAL CHONDRODYSPLASIA (SMCD), A DOMINANTLY INHERITED DISORDER OF THE CSEGOUS SKELETON. THE CARDINAL PEATURES OF THE PHENOTYPE ARE MILD SHORT STATURE, COXA VARA AND A WADDLING GAIT. RADIOGRAPHY USUALLY SHOWS SCLEROSIS OF THE RIBS, FLARING OF THE MITAPHYSES, AND A WIDE IRREGULAR GROWTH PLATE, ESPECIALLY OF THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DISEASE: DEFECTS IN COL10A1 ARE THE CAUSE OF SPONDYLOMETAPHYSEAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PROSTITE; PS01113; C10; 1.

ALTERNATIVE PRODUCTS: At least 3 isoforms; A (shown here), B and conduced by alternative splicing. There is alternative usage of exon IIA or exon IIB. Transcripts containing exon IIA or exon IIB are present in cartilage, but exon IIB is preferentially utilized in transcripts from tendon.

TISSUE SPECIFICITY: Cartilage, placenta and some tumor or virally transformed cell lines. Isoforms using exon IIA or IIB are found in the cartilage while isoforms using exon IIB are found in

PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

CAIB_HUMAN STANDARD; PRT; 1806 AA. P12107; Q14034; Q9UIT4; Q9UIT5; Q9UIT6; 01-OCT-1989 (Rel. 12, Created)

type 2 (STL2), also known as vitreous type 2, or beaded vitreous type 2 (STL2), also known as vitreous type 2, or beaded vitreous type 2 due to the presence of irregularly thickened fiber bundles type, due to the presence of irregularly thickened fiber bundles throughout vitreous cavity. Stickler syndrome (STL) (hereditary disorder characterized by progressive myopia beginning in the first decade of life, vitreo-retinal degeneration, retinal and sensorineural hearing loss.

1. DISBASE: Defects in COLILAI are the cause of Marshall syndrome, an autosomal dominant disorder with ocular, oro-facial, auditory and sheletal manifestations. It shares several features with Stickler syndrome, such as midfacial hypoplasia, high myopia, and sensorineural-hearing deficit.

2. SIMILARITY: BELONGS TO THE FIBRILAR CLASS OF COLLAGENS.

2. SIMILARITY: HIGH, TO ALPHA I(V) AND ALPHA 3(V) CHAINS.

-1- ALTERNATIVE PRODUCTS: 2 isoforms; I/a (shown here) and II/b; are produced by alternative splicing.
-1- DEVELOPMENTAL STAGE: ISOFORM 1 is predominant in embryos and isoform II is predominant in the larvae and adults.
-1- DOMAIN: ALPHA CHAINS OF TYPE IV COLLAGEN HAVE A NONCOLLAGENOUS DOMAIN (CLI) AT THEIR C-TERMINUS, FREQUENT INTERRUPTIONS OF THE G-YERMINIST IN THE LONG CENTRAL TRIPLE-HELICAL DOMAIN (WHICH MAY CAUSE FLEXIBILITY IN THE TRIPLE HELIX), AND A SHORT N-TERMINAL TRIPLE HELIX), AND A SHORT N-TERMINAL TRIPLE HELIX), AND A SHORT N-TERMINAL THE PTW: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXILATED IN SOME OR ALL OF THE CHAINS.
-1- PTW: TYPE IV COLLAGENS CONTAIN NUMBEROUS CYSTEINE RESIDUES WHICH

It is an autosomal dominant disorder characterized by oro-facial, auditory and skeletal manifestations, such as midfacial hypoplasia, cleft palate, osteoarthrits, and sensorineural hearing loss. Differently from Stickler syndrome type 1 and 2, no ocular involvement is observed. This disorder is also referred to as Stickler-like syndrome or non-ocular Stickler

              A; Description: structural component of extracellular fibrous polymer that maintains inte c; Superfamily: collagen alpha 1(I) chain; fibrillar collagen carboxyl-terminal homology; C; Keywords: colled coll; Ehlers-Danlos syndrome; extracellular matrix; glycoprotein; hyd F; 1-23/Domain: signal sequence #status predicted <SiG. F; 24-153/Domain: amino-terminal propeptide #status predicted <PRO>F; 31-91/Domain: von Willebrand factor type C repeat homology <VWC>F; 154-1221/Product: collagen alpha 1(III) chain #status predicted <MAT>F; 154-167/Region: helical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A. Map position: 2931-2931
A. Introns: 27/1; 94/3; 111/3; 149/3; 176/3; 554/3; 587/3; 1175/3; 1275/1; 1337/3; 1418/3
A. Introns: 27/1; 94/3; 111/3; 140/3; 554/3; 567/3; 1175/3; 1275/1; 1337/3; 1418/3
A. Note: the list of introns is incomplete; defects in this gene can result in Ehlers-Dan C. Complex: type III collagen is a homotrimer of monomers initially linked by disulfide be of their length, is formed with desmosine cross-links made from lysine and allysine in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A. Molecule type: mRNA A. Molecule type: mBN Molecule type: mBN Molecule type: mV Mol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C;Comment: Prolines and lysines at the third position of the tripeptide repeating unit 3-hydroxylated. About 15% of the lysines are 5-hydroxylated and some are subsequently C;Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Note: the authors translated the codon TTC for residue 1057 as Tyr; the codons given

Sucrose-proton transport protein - carrot
N.Alternate names: sucrose/H+ symporter protein
C;Species: Daucus carota (carrot)
C;Accession: T14340
R;Shakya, R.; Sturm, A.
Plant Physiol. 118, 1473-1480, 1998
A;Title: Characterization of source- and sink-specific sucrose/H+ symporters from car A;Reference number: Z17991; MUID:99063785; PMID:9847123
A;Accession: T14340
